Re: Application for AI and KM Consultant, Department of Monitoring, Evaluation, and Learning (DMEL)

Dear Hiring Team,

A few years ago at WMO, nobody asked me to build a tracking system. I just kept watching Programme Managers lose time to spreadsheets that couldn't talk to each other, so I sat with them, figured out where things actually broke, and built a SharePoint system around that instead. That's more or less how I approach most of my work: find the point where information stops flowing cleanly between people, and fix it. *It's also, I think, why this role caught my eye rather than something more narrowly technical or more narrowly research-based, it's the same instinct, just with a sharper set of tools now.*

That WMO system is still in use, monitoring a portfolio of 100+ climate and hydromet projects, and I built parts of it on Power Automate so updates didn't depend on someone remembering to do them manually, the same instinct I'd bring to the AI agents this role is building now, just with a different toolset. I also co-led the migration of 2,500+ institutional documents into a new CMS around then, which meant building a metadata taxonomy that would still make sense to someone searching for a record two years later, and getting it through UN records compliance without cutting corners. Repositories like that only stay useful if someone keeps asking "would a stranger find this in six months," and that's the question I'd bring to GCF's knowledge assets too.

My graduate degree is in African Studies with a Climate and Resilience focus rather than a formally titled information-management field, but the thesis and fieldwork were built around risk data, monitoring frameworks, and translating them for decision-makers, the same substance the listed fields point at, applied directly to climate work.

On AI specifically: I didn't wait for a job to tell me to use it. GitHub Copilot and Cursor are just part of how I write code now, the same way Claude and ChatGPT are part of how I think through a problem before I've fully worked it out myself. I use Midjourney and Canva/Adobe's AI tools for visual work, Gamma and Notion AI when I'm putting a knowledge product together. In my current work as an independent consultant, that's not incidental, it's how I keep the workflow systems and reporting frameworks I build for clients running without needing a bigger team behind me.

None of this is exotic, it's closer to a habit than a skill I'd list. The clearest proof is probably a [personal photography portfolio site](#) I built and still maintain on my own time: nothing about the job required it, I just wanted the site to sort entries by date, filter by tag, and fail gracefully if I typo'd something in the data file, and I leaned on AI coding assistants for the parts of the code I didn't already know. That's the same posture I'd bring to running quick AI experiments here, try it, see what breaks, fix the part that matters.

The other half of what I'd bring is translation. At UNHCR's Global Protection Cluster, I was the point of contact between 15+ field operations and the global communications team, which meant taking field-level detail that made sense to the people living it and turning it into something a donor or member state would actually read. I imagine a fair amount of this role is the same kind of work, sitting between GCF's technical teams and everyone else who needs the short version.

And on the data side, I've done the less glamorous version of this before too: producing analytical reports from participation and outcome data for national stakeholders at the Local Government Academy, and knowledge

products for five Communities of Practice at WMO, both of which came down to the same discipline of chasing a data quality issue until it was actually resolved, not just noted.

Between the AI and agent-building side of this role, the repository and knowledge-product work, and the data coordination across teams, I think this covers the three areas DMEL is hiring for, and I'd welcome the chance to bring all of it to the team. I'm happy to provide anything further or sit a written test as part of the process.

Sincerely,

A handwritten signature in black ink, consisting of a series of loops and a long horizontal stroke, positioned over the printed name.
